

## Description - Specifications

FERTICELL SALINITY CARBO is an organic liquid product based on chelating and complexing properties of polycarboxylic acids and polyamines that act in the balance and ionic exchange (Ca<sup>++</sup>, Na<sup>+</sup>, etc.)

FERTICELL SALINITY CARBO is composed of reducing substances, amino acids, carbohydrates and non-volatile organic acids that make up a concentrate of organic molecules and chelated minerals.

The FERTICELL SALINITY CARBO treatment reduces and/or improves hardness levels while improving the physical-chemical conditions of irrigation water.

It works by reducing the SAR of the water, thereby accelerating infiltration and preventing soil sodification, improving the structure and decreasing the toxicity factor of the sodium ion in crops.

FERTICELL-SALINITY CARBO decreasing levels of Electrical Conductivity (EC), the percentage of Exchangeable Sodium (PES) and the Sodium Absorption Ratio (SAR).

## Uses

Foliar application

## Containers available

10L  
20L  
300L  
600L  
1000L

## ATTESTATIONS:

## GUARANTEED ANALYSIS:

Composition	Percentage (p/p)
Total Nitrogen	≥0.2%
Carboxylic Acids	50%
Total Calcium (CaO)	≥0.10%

## PHYSICAL PROPERTIES

State:	Liquid
Color:	Brown
Density:	1.15 ± 0.01kg/l
pH:	<0.50

## GENERAL RECOMMENDATIONS FOR USE AND DOSAGE

Foliar application rates

### Recommendations:

Ferticell Salinity Carbo can be mixed with most pesticides, any nitrogen fertilizer, and most herbicides. It should not be mixed with phosphates containing more than 6% P<sub>2</sub>O<sub>5</sub>.

### Dosage and applications

Based on water and soil analysis, the Field Engineer will recommend, for each crop and at any stage of development, the number of applications of the following doses.

Drip application: 2-4L/ha
